

NISHA RATHOD

LEAD SOFTWARE ENGINEER - BACKEND ENGINEERING

CAREER HIGHLIGHTS

EXPERIENCE

A software professional with 6 years of experience.

EXPERTISE

Developing AWS Serverless application using AWS Lambda, RDS, DynamoDB, Elastic Search, API gateway, Cognito, AppSync, OpenSearch, AWS S3, Amplify, Developing Azure Serverless application using Azure Functions, CosmosDB with MongoDB API (Serverless & Thought put), API management, Storage Account, Event Grid, Azure Logic Apps

EDUCATION

Bachelor's Degree in, Computer Science

DOMAIN SKILLS

FINANCIAL SERVICES

Payment Services, E-Commerce, ERP

CONSUMER PACKAGED GOODS

Supply Chain, Logistics, Inventory Management

SOCIAL NETWORK

Services, Travel

HEALTHCARE

Clinical Apps

TECHNOLOGY SKILLS

PROGRAMMING LANGUAGES

JavaScript, TypeScript

JAVASCRIPT BACKEND

Node.js

DATABASES - SQL

MySQL, PostgreSQL, MariaDB

DATABASES - NOSQL

MongoDB, Elasticsearch

DATABASES - AWS

Aurora, DynamoDB

DATABASES - AZURE

Cosmos

OPERATING SYSTEM

Linux, macOS

AGILE TOOLS

Jira, BitBucket

VERSION CONTROL

Git, BitBucket

DEVELOPMENT TOOLS

CI/CD

Azure DevOps

CLOUD PLATFORMS

Amazon AWS, Microsoft Azure

CAREER EXPERIENCE

BlinkCNS is dedicated to improving the detection, differentiation and management of neurological disease through rapid, noninvasive collection of objective data from the eyes

PRODUCT: BlinkCNS Mobile App

Lead Software Engineer (1 year)

SOLUTION

Taking Scan of a Face with 240fps and upload to cloud for further processing with patients and view scan result with few AI gesture.

DOMAIN

Healthcare

ARCHITECTURE

React Native Mobile Application which can be portable for IOS and Android. Extended for the Native code to support few hardware connectivity. Uses AWS Amplify for setup and AWS Cognito for User Authentication.

RESPONSIBILITY

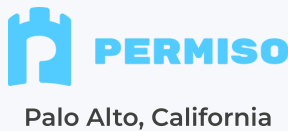

To formulate the system architecture in accordance with explicit requirements, chosen technology stack, and cloud environments, To create meticulously crafted and secure REST APIs that adhere to industry best practices, employing AWS Amplify, To devise each feature or module utilizing the Domain-Driven Design (DDD) approach, To construct a DevOps deployment architecture following industry best practices, To develop the fundamental features of the system in alignment with assigned Epics and User Stories

CONTRIBUTION

Engineered REST APIs employing Node.js, AWS Amplify, AWS Lambda, AWS AppSync, API Gateway, and DynamoDB, Developed database migration scripts utilizing AWS Lambda functions, Participated in peer code reviews and collaborative pair-programming sessions, Established a Continuous Integration/Continuous Deployment (CI/CD) pipeline through the utilization of Github Actions

TECH STACK

Backend: NodeJS, GraphQL, AWS Services: AWS DynamoDB, Lambda, API gateway, SQS, ECR, AppSync, OpenSearch, Cognito, S3

A Stealth Silicon Valley startup is developing a security platform for access rights and controls. Enterprises are experiencing an increase in intrusions and compromises as they move to the public cloud. The company is securing identities and entitlements of cloud-based enterprise solutions.

PRODUCT: Cloud Identity and Access Management Security

Sr. Software Engineer (9 months)

SOLUTION

The platform connects with their client's public cloud-native security service, such as AWS IAM, to map out the security privileges and policies assigned to users and other service and analyzes them using AI-Analytics and mitigate risks with the access privileges.

DOMAIN

Cybersecurity

ARCHITECTURE

The platform is built using AWS cloud-native serverless architecture, specifically AWS Lambda using Node.js to analyze the security policies of specific target web applications. It analyzes the access patterns to visualize risks with wrong or excessive privileges.

RESPONSIBILITY

To undertake the development of the essential features of the system, guided by the designated Epics and User Stories, And to implement backend microservices in accordance with established best practices and the principle of separation of concerns.

CONTRIBUTION

Engineered a microservice utilizing Typescript, culminating in the establishment of an AWS Lambda API, Implemented the configuration of AWS APIs within the system to facilitate the retrieval of configuration settings from Amazon Web Services.

TECH STACK

Backend: NodeJS, Typescript, PostgreSQL, AWS Lambda, AWS RDS , Cloud: AWS

Santa Monica,
California

Beachbody is the creator of some of the world's most popular fitness programs which transformed the in-home fitness market making it accessible for people to get results—anytime, anywhere. The streaming service has millions of subscribers and includes hundreds of hours of premium content along with customized nutrition guides, workout calendars, and cooking shows. It has a network of over half-a-million coaches to provide peer support and accountability to help customers achieve and maintain real results.

PRODUCT: Site Reliability Engineering

Sr. Software Engineer (1 year)

SOLUTION

The cloud-native production system on AWS needed cloud-operations support for Site Reliability Engineering. The ops team was tasked to ensure production system delivered 24x7x365 site reliability and met the Service-Level-Objectives (SLOs) by monitoring and optimizing the complex services.

DOMAIN

SRE, AWS

ARCHITECTURE

The site reliability engineering team provided the vital production-level support using the proven agile DevSecOps, development, and testing services of AWS cloud-native massively scalable fitness platform. The team worked with business team to establish SLOs, monitoring, troubleshooting, and optimization to keep this billion-dollar platform available, secure, and performing at optimal levels.

RESPONSIBILITY

To undertake the development of backend microservices in accordance with established best practices and the principle of separation of concerns, Diagnose and rectify any issues or bugs identified during testing or deployment

CONTRIBUTION

Engineered microservices using Node.js, leading to the deployment on the AWS Lambda platform, Write the code for the Lambda functions according to the specified requirements and design, Utilize the Serverless framework to streamline deployment and management, Implement security best practices to safeguard the Lambda functions and associated resources

TECH STACK

Backend: NodeJS, AWS Lambda, Serverless, DynamoDB

London, London

Bunzl plc is a British multinational distribution and outsourcing company headquartered in London, England.

PRODUCT: SmartConnector

Sr. Software Engineer (6 months)

SOLUTION

To develop an Integration hub for various ERP systems and reporting tools.

DOMAIN

ERP

ARCHITECTURE

API based Azure cloud native architecture

RESPONSIBILITY

To cultivate backend microservices adhering to best practices and the principle of separation of concerns, To construct workflows utilizing Azure Logic App, To create fundamental features of the system aligned with assigned Epics and User Stories, To formulate well-designed and secure REST APIs that adhere to industry best practices, To consistently contribute code through the adoption of unit testing, pair programming, and code review processes

CONTRIBUTION

Engineered microservices utilizing Node.js, culminating in the deployment as Azure functions, Constructed an Azure Logic App employing various Azure connectors and functions, Participated in peer code reviews and collaborative pair-programming sessions

TECH STACK

Backend: NodeJS, Azure Functions, Serverless, CosmosDB, Event Grid, Logic App, API management service

Auburn Hills,
Michigan

MFGx are experts in the integration and implementation of all enterprise software applications. Their product, Fuuz™, is a no-code, low-code, pro-code application platform that delivers on the promise of Industry 4.0

PRODUCT: MFGx FuuZ Platform

Sr. Software Engineer (3 months)

SOLUTION

MFGx's FuuZ Platform is a Low-code, No-code solution for automating processes in the Manufacturing Industry.

DOMAIN

Low-code

ARCHITECTURE

ReactJS, NodeJS, microservices, MongoDB, Docker, Kubernetes

RESPONSIBILITY

To develop new features & Fixed existing issues, Utilized JSONata to develop functions

CONTRIBUTION

Fix few of exiting issues in System, Developed small features

TECH STACK

Backend: Javascript, NodeJs, JSONata

Virsec provides a multi-cloud application workload protection platform. The cybersecurity platform protects any application, patched or unpatched, across the full application stack from web threats to binary memory-based attacks.

PRODUCT: Node.js Application Probe

Sr. Software Engineer (3 month)

SOLUTION

High-performance application-specific probes, deployed with the applications or containers, provide stateful analysis on a per-user basis of complete web transactions, including HTTP and SQL requests and responses across web servers, app servers, and backend databases. The probes' logs are sent to an analysis engine to identify and remediate various cybersecurity threats.

DOMAIN

Application Security

ARCHITECTURE

Development of high-performance application probe for Node.js applications by intercepting execution thread within Node.js.

RESPONSIBILITY

To develop core features of the system, based on assigned Epics and User-Stories.

CONTRIBUTION

Developed probe using NodeJS resulting in NodeJS probe

TECH STACK

Backend: NodeJS, ExpressJs, MySQL, GraphQL

New York, New York

BetterSpaces is a digital & in-person workplace well-being solution. It provides the next generation of tenant amenities for landlords and enterprises through curated programming, community engagement, and thoughtful, well-designed spaces.

PRODUCT: Better Spaces

Sr. Software Engineer (9 months)

SOLUTION

BetterSpaces is a digital and in-person workplace well-being solution. As we witness the evolution of the way people work, we provide the next generation of tenant amenities for landlords and enterprises through curated programming, community engagement, and thoughtful, well-designed spaces.

DOMAIN

Health & Fitness

ARCHITECTURE

Google Cloud, NodeJS, Android, iOS, MySQL

RESPONSIBILITY

To develop well-designed and secure REST-APIs that follow industry best practices., To develop core features of the system, based on assigned Epics and User-Stories.

CONTRIBUTION

Developed REST APIS using NodeJS, Took part in peer code reviews and pair-programming sessions

TECH STACK

NodeJS, MySQL, Google Cloud

Lilburn, Georgia

Plan Intelligently is a unified intelligent platform that simplifies the complex process of planning, procurement and logistics into a simple and dynamic operation. We help manufacturing companies optimize their supply chain by providing end-to-end visibility, traceable collaboration and accountability.

PRODUCT: Plan Intelligently

Software Engineer (1 year)

SOLUTION

Plan Intelligently is a unified intelligent platform that simplifies the complex process of planning, procurement and logistics into a simple and dynamic operation. We help manufacturing companies optimize their supply chain by providing end-to-end visibility, traceable collaboration and accountability.

DOMAIN

Supply chain Management

ARCHITECTURE

AWS Cloud, AWS Lambda, NodeJS, MongoDB, Angular

RESPONSIBILITY

To develop core features of the system, based on assigned Epics and User-Stories., To develop backend microservices using best practices and separation-of-concern., To develop well-designed and secure REST-APIs that follow industry best practices.

CONTRIBUTION

Developed micro-service using NodeJS resulting in AWS lambda API

TECH STACK

AWS Cloud, AWS Lambda, NodeJS, MongoDB, Angular

NOTEWORTHY

- Proficient in resolving intricate issues necessitating a substantial degree of debugging and root-cause analysis.

- Enthusiastic about acquiring knowledge in emerging technologies and design patterns relevant to cloud-native platforms.
- A steadfast commitment to quality underscores my ability to strategize comprehensive testing procedures from various perspectives.
- Engaged in the complete application lifecycle.
- Proficient in Serverless and Microservices-based architectural frameworks.
- Capable of optimizing database configurations and proficient in crafting performance-oriented queries.
- Engineered and implemented REST APIs incorporating third-party integrations and database functionalities.
